

What have I done?

In the past week I was able to set up my first repository. It was a struggle getting it started, but after a lot of leg work and research, it finally came together. I've learned a lot about time management for this class, and research techniques. Asking classmates for advice and contacting the instructor was very helpful when completing and understanding my assignments this past week.

What am I doing?

I'm currently locking down a better schedule to complete my work. I'm also working on scheduling a good amount of time to do significant research for most of my assignments this week. I plan on taking more time to research GIT Hub and checking out more tutorials on programming fundamentals.

What's Next?

In the coming month I want to delve into more development exercises. There are a number of resources online that I can use to practice code and learn new methods. This seems to be the perfect class to take the time to learn more that I can put into my portfolio. I also plan on doing more research on portfolio examples that may help me with mine in the future.

How to?

I can do all of these things by utilizing the SWOT method. I'm good at developing a solid plan and method for work, but I'm weak when it comes to time management. I can work on both of these things in order to find a strong middle ground in order to complete my work and find time for research.
