

This week was extremely challenging for me. Not having a background in programming and now having to jump in a developers world head first, was difficult. I think I'm finally starting to understand how GitHub works, and I honestly enjoy this way of learning. For the first time I've really felt like I needed to reach out for help from my classmates and they were very helpful.

Casey Scott was very helpful with the links and information he gave out from his experiences. Also, the Lynda video was helpful in the beginning. There was a lot of trial and error this week, but I feel like I'm ready to move onto the next part of the class.

This week was difficult also in my every day life. I'm in the middle of moving and working full time. Money is short, no free time, working, single parent, school, and moving all at once has been draining me. What I've learned is that even when I'm tired, this class interests me enough and motivates me to take the time to search out the answers. It's challenging like a crossword puzzle and instead of making me feel like giving up, it motivates me to solve the problem. I think this is something I should keep in mind moving forward in this career path.
